                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Ş
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This invention describes a novel sphingolipid desaturase that selectively cc introduces a double bond into the sphingobase of the ceramide residue of c sphingolipids and capnoids. A DNA sequence encoding the sphingolipid cc desaturase, or a vector containing the DNA sequence, can be used to c produce transgenic plants, especially crop plants, with an increased or cc decreased delta-8-unsaturated long-chain base content or an altered content-sequence, can be used to compensate for a delta-8-unsaturated long-chain base deficiency, to cc exclude production of delta-8-unsaturated long-chain base deficiency, to cc exclude production of delta-8-unsaturated bases, to increase tolerance cc or resistance to soil salinity, ion stress or toxicity, drought, wet conditions, cold or frost and/or phytopathogenic microorganisms, or to calter size growth and flowering time. Cells, transgenic organisms or cc plants containing the DNA sequence can be used to produce sphingolipids can desponids with unsaturated sphingobases. The sphingolipids or capnoids can be used in cosmetics, pharmaceuticals and foods and as chemical raw can be used in cosmetics, pharmaceuticals and foods and as chemical raw desaturase sld1 protein described in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Query Match

The nucleic acid and a vector expressing the nucleic acid are useful for producing a plant such as sunflower, soybean, maize, tobacco, peanut, carrot or oil seed rape plant, with increased gamma linolenic acid (GLA) content, and also for inducing or increasing production of GLA in a bacteria or plant deficient, lacking in or producting low levels of GLA. The nucleic acid is also useful for inducing chilling tolerance in plants. This is the amino acid sequence of the evening primrose delta6 desaturase involved in the production of gamma linoleic acid.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Novel nucleic acid encoding evening primrose delta6-desaturase which converts linoleic acid to gamma linolenic acid useful for producing gamma linolenic acid in transgenic plant or bacteria -

The nucleic acid, a vector comprising the nucleic acid or a nucleic acid or a nucleic acid or a nucleic acid or a sunflower, soybean, maize, tobacco, peanut, carrot or oil seed rape plant) with increased gamma-linolenic acid (GLA) content by transforming a plant cell with the nucleic acid or vector and regenerating a plant with increased GLA content from the plant cell, for inducing or increasing production of GLA in an organism lacking in or producing low levels of GLA and for inducing production of octadecatetraenoic acid in at least one of a plant deficient or lacking in or producing low levels of octadecatetraenoic acid, a bacterium which produces alpha-linolenic acid or a bacterium which exhibits a delta-15-desaturase activity on a GLA subscrate. This sequence represents an evening primrose delta-6-desaturase polypeptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Novel nucleic acid encoding evening primrose delta-6-desaturase, useful for producing plant with increased gamma linolenic acid content, and for inducing octadecatetraenoic acid production in plant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   WPI; 2003-066659/06.

                                                                                                                                                                                                                                                                                                                                                                                               문
                                                                                                                                                                                                                                                                                       S
                                                                                                                                                                                                                                                                                                                                                                                                                         This invention describes a novel sphingolipid desaturase that selectively cintroduces a double bond into the sphingobase of the ceramide residue of csphingolipids and capnoids. A DNA sequence encoding the sphingolipid cC desaturase, or a vector containing the DNA sequence, can be used to produce transgenic plants, especially crop plants, with an increased or decreased delta-8-unsaturated long-chain base content or an altered congensate for a delta-8-unsaturated long-chain base content or an altered compensate for a delta-8-unsaturated long-chain base deficiency, to cc compensate for a delta-8-unsaturated long-chain base tolerance cc exclude production of delta-8-unsaturated bases, to increase tolerance cc conditions, cold or frost and/or phytopathogenic microorganisms, or to cc alter size growth and flowering time. Cells, transgenic organisms or cc plants containing the DNA sequence can be used to produce sphingolipids and capnoids with unsaturated sphingobases. The sphingolipids or capnoids can be used in cosmetics, pharmaceuticals and foods and as chemical raw materials. This sequence represents a sphingolipid desaturase protein conditions.
                                                                                                                                                                                                                                                                                                                            Best Local Sir

No. 1.1e-72; Matches 131; Conservative 50; Mismatches 72; Indels 15; Gaps This sequence corresponds to the borage (Borago officinalis) delta-6 desaturase enzyme. The encoding lipid metabolism gene is an example of a heterologous gene which can be expressed at high levels in a seed-specific manner in transgenic plants, when placed under control of the sunflower albumin gene 5' regulatory region (AAV34397). Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

"Delta 12 fatty acid desturase gene of Mortierella alpina.";
Submitted (SEP-2001) to the EMBL/GenBank/DDBJ databases.
-!- FUNCTION: Catalyzes the desaturation of oleic acid (delta9-1
to linoleic acid (delta9, delta12-18:2).
-!- PATHWAY: C20 polyunsaturated fatty acid biosynthesis.
-!- SUBCELLULAR LOCATION: Integral membrane protein (Potential)
-!- DOMAIN: The histidine box domains may contain the active sit and/or be involved in metal ion binding.
-!- SIMILARITY: BELONGS TO THE FATTY ACID DESATURASE FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                 "Identification of deltal2-fatty acid desaturase from arachidonic acid-producing Mortierella fungus by heterologous expression in the yeast Saccharomyces cerevisiae and the fungus Aspergillus oryzae."

Eur. J. Biochem. 261:812-820(1999).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Oxidoreductase; Iron; Complete proteome. Submitted (SEP-2001) to the EMBL/GenBank/DBJ databases.
-!- FUNCTION: Catalyzes the desaturation of oleic acid (delta9-18:1)
to linoleic acid (delta9, delta12-18:2) (By similarity).
-!- PATHWAY: C20 polyunsaturated fatty acid biosynthesis.
-!- SUBCELLULAR LOCATION: Integral membrane protein (Potential).
-!- DOMAIN: The histidine box domains may contain the active site and/or be involved in metal ion binding.
-!- SIMILARITY: BELONGS TO THE FATTY ACID DESATURASE FAMILY.
                                                                        Omega-6 fatty

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Misawa N., Kajiwara S., Kondo K., Yokoyama A., Satomi Y., Saito T., Miki W., Ohtani T.;

"Canthaxanthin biosynthesis by the conversion of methylene to keto groups in a hydrocarbon beta-carotene by a single gene.";

Biochem. Biophys. Res. Commun. 209:867-876(1995).

-i- FUNCTION: CONVERTS BETA-CAROTENE TO CANTHAXANTHIN VIA ECHINENONE.

-i- PARTHMAY: CAROTENOID BIOSYNTHESIS. INVOLVED IN ASTAXANTHIN BIOSYNTHETIC PATHWAY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This SWISS-PROT entry is copyright. FUNCTION. CHLOROPLAST OMEGA-6 FATTY ACID DESATURASE INTRODUCES THE SECOND DOUBLEBOND IN THE BIOSYNTHESIS OF 16:3 AND 18:3 FATTY ACIDS, IMPORTANT CONSTITUENTS OF PLANT MEMBRANES. IT IS THOUGHT TO USE FERREDOXIN AS AN ELECTRON DONOR AND TO ACT ON FATTY ACIDS EXTERIFIED TO GALACTOLIPIDS, SULFOLIPIDS AND PHOSPHATIDYLGLYCEROL. SUBCELULAR LOCATION: CHLOROPLAST, MEMBRANE-BOUND (PROBABLE). DOWAIN: THE HISTIDINE BOX DOWAINS MAY CONTAIN THE ACTIVE SITE AND/ OR BE INVOLVED IN METAL ION BINDING.

SIMILARITY: BEHONGS TO THE FATTY ACID DESATURASE FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            NEXOS

RT "RIKEN Arabidopsis full length cDNA clones (RAFLs) sequenced by the RT SSP consortium (Salk/Stanford/PGEC).";
SUDMITTION: CHLOROPLAST OMEGA-6 FATTY ACID DESATURASE INTRODUCES THE SECOND DOUBLEBOND IN THE BIOSYNTHESIS OF 16:3 AND 18:3 FATTY CC TO USE FERREDOXIN AS AN ELECTRON DONOR AND TO ACT ON FATTY ACIDS ESTERIFIED TO GALACTOLIPIDS, SULFOLIPIDS AND PHOSPHATIDYLGLYCEROL.
CC -I- DETERLIFIED TO GALACTOLIPIDS, SULFOLIPIDS AND PHOSPHATIDYLGLYCEROL.
CC -I- SUBCELLULAR LOCATION: CHLOROPLAST, MEMBRANE-BOUND (PROBABLE).
CC -I- SUBCELLULAR LOCATION: CHLOROPLAST, MEMBRANE-BOUND (PROBABLE).
CC -I- DOMAIN: THE HISTIDINE BOX DOMAINS MAY CONTAIN THE ACTIVE SITE CC -I- DOMAIN: THE HISTIDINE BOX DOMAINS MAY CONTAIN THE ACTIVE SITE CC -I- SIMILARITY: BELLONGS TO THE FATTY ACID DESATURASE FAMILY.
